

Your GLUTEN problem may actually be caused by GLYPHOSATE

Reprinted from naturalnews.com

Are you sensitive to gluten? Your problem with wheat, it turns out, may not be a problem with gluten at all. It may, in fact, be a problem with GLYPHOSATE, a widely used herbicide.

Most people don't realize it, but even though wheat is not yet commercially grown as a genetically engineered crop, farmers saturate wheat crops with very high doses of glyphosate right before harvest, speeding the drying of the wheat stalks and accelerating harvest duration.

The result is that toxic, cancer-causing glyphosate herbicide is now found in many wheat products, including pasta, wheat bread, wheat flake breakfast cereals, donuts, bagels, cake mixes, snack crackers and much more.

Glyphosate is known to be toxic at parts per billion concentrations, meaning it only takes a very tiny amount to potentially impact your digestion and metabolism in a dangerous way.

What's the solution to glyphosate in wheat products? Buy ORGANIC wheat, which isn't legally allowed to be sprayed with glyphosate.

Once you switch to organic wheat, you may discover your "gluten" problems simply disappear... and that's because it wasn't a gluten problem to begin with. It was glyphosate poisoning!
